

SimpleXess  
FOR USE WITH SAP®

This is how easy it is to query and further process data from SAP® in a flexible and cost-effective manner

**SimpleXess**  
FOR USE WITH SAP®

## **SimpleXess – the new standard for powerful and cost-effective ETL tools**

Finally! SimpleXess offers you an ingeniously simple, secure and flexible tool that allows you to specifically download ERP data in SAP® and use this data for local applications. The program is designed for company departments that want to independently optimize its processes live with centralized company data, as often as desired and at a fixed low price.

The simple controls, flexible usage and robust security architecture of SimpleXess opens up completely new perspectives, which allow you to tightly integrate centralized and decentralized processes in your company in a cost-effective manner and coordinate these more efficiently with each other.

SimpleXess seamlessly integrates with the company-specific SAP® security structure. Our tool allows you to flexibly query centralized databases and integrate these in local applications without the need for in-depth SAP® knowledge. SimpleXess runs on any desktop even without a server; it is easy to learn and can be deployed quickly in production.

The costs for the usage of SimpleXess are fully transparent and can always be calculated since the licensing of SimpleXess is realized independently of usage intensity via an annual subscription price. For companies that require department- and company-wide licenses the low yearly subscription fee is staggered for an even greater benefit.

Ingeniously simple, surprisingly affordable and sustainably efficient! SimpleXess is a company-internal development by nicetec, the leading German specialist for IT financial management solutions for over a decade.

FOR USE WITH SAP®

#### **SimpleXess:**

#### **Uses SAP® data intelligent for decentralized processes**

SimpleXess is a powerful ETL tool for your company department. Without in-depth SAP® knowledge you can query centralized data from the ERP system in a secure, flexible and cost-effective manner and integrate this data in your decentralized applications and processes.

Now you can independently and conveniently use insights from centralized processes for local applications and precisely filter the information you require from large data volumes in order to optimize your business processes on a local level.

With SimpleXess you are always in compliance with the security regulation of your company. You neither require in-depth SAP® knowledge nor do you have to rely on the support and availability of the IT department. The user interface of SimpleXess has been designed so that an induction time of one to two days is usually sufficient to achieve the competence to execute even complex queries to the ERP system. The centralized databases in the SAP® system will certainly remain untouched.

SimpleXess allows you to access the centralized databases in SAP® as often, extensively and flexibly as you desire at extremely low costs. Finally you can optimize your local processes with centralized data around the clock.

**SimpleXess**  
FOR USE WITH SAP®

### **SimpleXess:**

#### **Focuses on the security of your company**

In order to communicate with SAP® via SimpleXess you must have an account on the SAP® system. The rights management is realized exclusively via the rights management in your SAP® system. This ensures that your access to SAP® data is compliant with the regulations of your company as defined in your personal user account.

The rights management of SAP® remains fully intact and untouched. Another safety relevant aspect is that SimpleXess does not install any additional software on the SAP® servers in your company and changes to databases in the SAP® system are ruled out.

### **SimpleXess:**

#### **Focuses on flexible deployment possibilities**

SimpleXess allows you to rely on SAP® tables, BAPIs, RFCs and Z functional modules in your search profile. You can illustrate complex if-then decisions, define various search strategies, set filters, request outside parameters, synchronize data or combine a data search in the SAP® system with search processes in the target system. You can configure your search profile in such a way that data found in the SAP® system can be compared with data from a database that has already been created in the target system. Another setting lets you copy over only new datasets or update already existing ones.

**SimpleXess**  
FOR USE WITH SAP®

The following are some of the common task fields for SimpleXess: the query of economic indicator numbers in the context of preparing reports for the board, the indexation of documents with SAP® data in a document management system or the automatic comparison of warehouse goods in a webshop with the SAP® storage management system.

The comprehensive functionality of SimpleXess clears the way for optimal usage of centralized data in decentralized tasks.

### **SimpleXess:** **Focuses on flexible deployment possibilities**

The cost expenditure for SimpleXess is extremely low – regardless of the usage frequency of the tool. This ensures clarity and transparency of costs. SimpleXess is licensed with an annual subscription fee, which also covers a support- and maintenance contract and therefore all updates and upgrades.

The price model for SimpleXess finally closes the market gap between highly flexible, expensive solutions and cheap desktop applications that only offer a rigid functionality concept with minor flexibility.

FOR USE WITH SAP®

### “Extremely quick and easy”

“SimpleXess is the quickest and simplest way to precisely draw structured data from SAP® and make this data available for further evaluations of other systems. SimpleXess does not create an ABAP code that has to be installed on SAP® systems; this alleviates the need for respective clearance procedures.

SimpleXess also supports the required analysis of SAP® data so that scarce and expensive development resources for the realization of an ETL process do not have to be utilized.

According to my own experience the preparation time for data transformation from SAP®, even without an in-depth knowledge of the ERP system, can be reduced to a maximum of two days.“

Claus W., Senior Solution Architect, International Group
